

COMPLETE k -CURVATURE HOMOGENEOUS PSEUDO-RIEMANNIAN MANIFOLDS 0-MODELED ON AN INDECOMPOSIBLE SYMMETRIC SPACE

P. GILKEY AND S. NIKČEVIĆ

ABSTRACT. For $k \geq 2$, we exhibit complete k -curvature homogeneous neutral signature pseudo-Riemannian manifolds which are not locally affine homogeneous (and hence not locally homogeneous). The curvature tensor of these manifolds is modeled on that of an indecomposable symmetric space. All the local scalar Weyl curvature invariants of these manifolds vanish.

Dedicated to Professor Sekigawa on his 60th birthday

1. INTRODUCTION

1.1. Affine manifolds. Let $\mathcal{A} := (M, \nabla)$ be an *affine manifold* where ∇ is a torsion free connection on a smooth manifold M . Let $\mathcal{R}_{\mathcal{A}}$ be the associated curvature operator:

$$\mathcal{R}_{\mathcal{A}}(\xi_1, \xi_2)\xi_3 := (\nabla_{\xi_1}\nabla_{\xi_2} - \nabla_{\xi_2}\nabla_{\xi_1} - \nabla_{[\xi_1, \xi_2]})\xi_3.$$

Let $\nabla^i \mathcal{R}_{\mathcal{A}}$ be the i^{th} covariant derivative of the curvature operator. If $P \in M$, let $\nabla^i \mathcal{R}_{\mathcal{A}, P}$ be the restriction of $\nabla^i \mathcal{R}_{\mathcal{A}}$ to $T_P M$. Consider the following algebraic structure which encodes the covariant derivatives of the curvature operator up to order k :

$$\mathfrak{A}^k(\mathcal{A}, P) := (T_P M, \mathcal{R}_{\mathcal{A}, P}, \dots, \nabla^k \mathcal{R}_{\mathcal{A}, P}).$$

We say that $\phi : \mathfrak{A}^k(\mathcal{A}_1, P_1) \rightarrow \mathfrak{A}^k(\mathcal{A}_2, P_2)$ is an *affine isomorphism* if ϕ is a linear map from $T_{P_1} M_1$ to $T_{P_2} M_2$ satisfying

$$\phi^* \{\nabla_2^i \mathcal{R}_{\mathcal{A}_2, P_2}\} = \nabla_1^i \mathcal{R}_{\mathcal{A}_1, P_1} \quad \text{for } 0 \leq i \leq k.$$

1.2. Pseudo-Riemannian manifolds. If $\mathcal{M} := (M, g)$ is a pseudo-Riemannian manifold of signature (p, q) and of dimension $m = p + q$, let ∇ be the Levi-Civita connection, let $\mathcal{A}(\mathcal{M}) := (M, \nabla)$ be the underlying affine structure, and let

$$R_{\mathcal{M}}(\xi_1, \xi_2, \xi_3, \xi_4) := g(\mathcal{R}_{\mathcal{A}}(\xi_1, \xi_2)\xi_3, \xi_4)$$

be the curvature tensor; $R_{\mathcal{M}} \in \otimes^4 T^* M$. Similarly, let $\nabla^i R_{\mathcal{M}}$ be the i^{th} covariant derivative of the curvature tensor. Let

$$\mathfrak{M}^k(\mathcal{M}, P) := (T_P M, g_P, R_{\mathcal{M}, P}, \dots, \nabla^k R_{\mathcal{M}, P}).$$

One says that $\phi : \mathfrak{M}^k(\mathcal{M}_1, P_1) \rightarrow \mathfrak{M}^k(\mathcal{M}_2, P_2)$ is an isomorphism if ϕ is a linear isomorphism from $T_{P_1} M_1$ to $T_{P_2} M_2$ so that

$$\phi^* \{g_{2, P_2}\} = g_{1, P_1} \quad \text{and} \quad \phi^* \{\nabla_2^i R_{\mathcal{M}_2, P_2}\} = \nabla_1^i R_{\mathcal{M}_1, P_1} \quad \text{for } 0 \leq i \leq k.$$

In this situation, the metric permits one to raise indices and conclude as well that

$$\phi^* \{\nabla_2^i \mathcal{R}_{\mathcal{M}_2, P_2}\} = \nabla_1^i \mathcal{R}_{\mathcal{M}_1, P_1} \quad \text{for } 0 \leq i \leq k.$$

Thus ϕ is also an isomorphism from $\mathfrak{A}^k(\mathcal{A}(\mathcal{M}_1), P_1)$ to $\mathfrak{A}^k(\mathcal{A}(\mathcal{M}_2), P_2)$ of the underlying affine structure.

Key words and phrases. Affine k -curvature homogeneous, k -curvature homogeneous, homogeneous space, symmetric space, Weyl invariants, vanishing scalar invariants
2000 *Mathematics Subject Classification.* 53B20.

We shall frequently simplify the notation by setting $\mathcal{R} = \mathcal{R}_{\mathcal{A}}$ or $R = R_{\mathcal{M}}$ when no confusion is likely to result.

1.3. Various notions of homogeneity. One is often interested in manifolds with a great deal of geometric symmetry. Sometimes this symmetry arises from a transitive group action; such manifolds are called *homogeneous*.

Definition 1.1.

- (1) An affine manifold $\mathcal{A} = (M, \nabla)$ is said to be *locally affine homogeneous* if given $P, Q \in M$, there is a diffeomorphism $\Phi_{P,Q}$ from a neighborhood of P to a neighborhood of Q so $\Phi_{P,Q}^* \nabla = \nabla$ and so $\Phi(P) = Q$.
- (2) A pseudo-Riemannian manifold $\mathcal{M} = (M, g)$ is said to be *locally homogeneous* if given $P, Q \in M$, there is a diffeomorphism $\Phi_{P,Q}$ from a neighborhood of P to a neighborhood of Q so $\Phi_{P,Q}^* g = g$ and so $\Phi(P) = Q$.

There are, however, other less restrictive notions of symmetry arising from the curvature operator and curvature tensor:

Definition 1.2.

- (1) One says that an affine manifold $\mathcal{A}$ is *affine k -curvature homogeneous* if $\mathfrak{A}^k(\mathcal{A}, P)$ and $\mathfrak{A}^k(\mathcal{A}, Q)$ are isomorphic for any $P, Q \in M$.
- (2) One says that a pseudo-Riemannian manifold $\mathcal{M}$ is *k -curvature homogeneous* if $\mathfrak{M}^k(\mathcal{M}, P)$ and $\mathfrak{M}^k(\mathcal{M}, Q)$ are isomorphic for any $P, Q \in M$.

One is interested finding manifolds which are affine k -curvature homogeneous but not locally affine homogeneous or which are k -curvature homogeneous but not locally homogeneous.

1.4. Previous results. There are 2-curvature homogeneous affine manifolds which are not locally affine homogeneous [9, 14, 15, 16, 21]. In the Riemannian setting ($p = 0$), Takagi [29] constructed 0-curvature homogeneous complete non-compact manifolds which are not locally homogeneous; compact examples were exhibited subsequently by Ferus, Karcher, and Münzer [8]. Many other examples are known [7, 17, 18, 19, 30, 31, 33, 34]. There are no known Riemannian manifolds which are 1-curvature homogeneous but not locally homogeneous. In the Lorentzian setting ($p = 1$) 0-curvature homogeneous manifolds which are not locally homogeneous were constructed by Cahen et. al. [6]; 1-curvature homogeneous manifolds which are not locally homogeneous were constructed by Bueken and Djorić [4] and by Bueken and Vanhecke [5].

1.5. Curvature homogeneity and homogeneity. It is clear that local homogeneity implies k -curvature homogeneity for any k . The following result, due to Singer [26] in the Riemannian setting and to F. Podesta and A. Spiro [23] in the general context, provides a partial converse:

Theorem 1.3 (Singer, Podesta-Spiro). *There exists an integer $k_{p,q}$ so that if $\mathcal{M}$ is a complete simply connected pseudo-Riemannian manifold of signature (p, q) which is $k_{p,q}$ -curvature homogeneous, then (M, g) is homogeneous.*

These constants were first studied in the Riemannian setting. Singer [26] showed $k_{0,m} < \frac{1}{2}m(m-1)$; subsequently Yamato [35] and Gromov [13] established the bounds $3m-5$ and $\frac{3}{2}m-1$ for $k_{0,m}$, respectively. Sekigawa, Suga, and Vanhecke [27, 28] showed any 1-curvature homogeneous complete simply connected Riemannian manifold of dimension $m < 5$ is homogeneous; thus $k_{0,2} = k_{0,3} = k_{0,4} = 1$. We refer to the discussion in Boeckx, Vanhecke, and Kowalski [2] for further details concerning k -curvature homogeneous manifolds in the Riemannian setting; Opozda [22] has established an analogue of Theorem 1.3 in the affine setting. Observe that our definition of $k_{p,q}$ differs slightly from that given elsewhere by certain authors.

We constructed [11] complete metrics of neutral signature $(p+3, p+3)$ on $\mathbb{R}^{2p+6}$ for any $p \geq 0$ which are $p+2$ -curvature homogeneous but not affine $p+3$ -curvature homogeneous [11]. The discussion there shows $k_{p,q} \geq \min\{p, q\}$.

1.6. Scalar invariants. One can use the metric to contract indices in pairs and form *scalar Weyl invariants*. Adopt the Einstein convention and sum over repeated indices. Let $R_{i_1 i_2 i_3 i_4}$ denote the components of the curvature tensor. The scalar curvature τ and the norm of the Ricci tensor $|\rho|^2$ are given respectively by:

$$\tau = g^{i_1 i_2} g^{j_1 j_2} R_{i_1 j_1 j_2 i_2} \quad \text{and} \quad |\rho|^2 = g^{i_1 j_1} g^{i_2 j_2} g^{i_3 j_3} g^{i_4 j_4} R_{i_1 i_2 i_3 j_1} R_{i_4 j_2 j_3 j_4}.$$

There is a related result concerning scalar invariants:

Theorem 1.4 (Prüfer, Tricerri, and Vanhecke [24]). *If all local scalar Weyl invariants up to order $\frac{1}{2}m(m-1)$ are constant on a Riemannian manifold $\mathcal{M}$, then $\mathcal{M}$ is locally homogeneous and $\mathcal{M}$ is determined up to local isometry by these invariants.*

This result fails in the pseudo-Riemannian setting; Koutras and McIntosh [20] gave examples of non-flat manifolds all of whose scalar Weyl invariants vanish; see also related examples by Pravda, Pravdová, Coley, and Milson [25].

1.7. Riemannian manifolds modeled on homogeneous spaces. One says that $\mathcal{M}$ is k -modeled on a homogeneous pseudo-Riemannian manifold $\mathcal{N}$ if $\mathfrak{M}^k(\mathcal{M}, P)$ and $\mathfrak{M}^k(\mathcal{N}, Q)$ are isomorphic for any $P \in M$ and $Q \in N$; the precise $Q \in N$ being irrelevant as $\mathcal{N}$ is homogeneous. One has the following results in the Riemannian and Lorentzian settings:

Theorem 1.5.

- (1) (Tricerri and Vanhecke [32]) *If a Riemannian manifold $\mathcal{M}$ is 0-modeled on an irreducible symmetric space $\mathcal{S}$, then $\mathcal{M}$ is locally isometric to $\mathcal{S}$.*
- (2) (Cahen et al. [6]) *If a Lorentzian manifold $\mathcal{M}$ is 0-modelled on an irreducible symmetric space, then $\mathcal{M}$ has constant sectional curvature.*

There is a bit of technical fuss here. Recall that a pseudo-Riemannian manifold $\mathcal{M}$ is said to be *irreducible* if the holonomy representation is irreducible, i.e. if $T_P M$ does not have any proper non-trivial subspace which is invariant under the holonomy representation for any (and hence for all) $P \in M$; $\mathcal{M}$ is said to be *indecomposable* if there does not exist a non-trivial decomposition of $T_P M$ which is invariant under the holonomy representation.

These two notions are equivalent in the Riemannian setting but are not equivalent in the higher signature setting. It is known that there are 1-curvature homogeneous 3-dimensional Lorentzian manifolds which are modeled on an indecomposable symmetric space (which is not irreducible) but which are not locally homogeneous; see [3, 4, 5, 6] for further details.

In this paper, we turn to the question of constructing pseudo-Riemannian manifolds which are 0-curvature modeled on an indecomposable symmetric space and which are k -curvature homogeneous for arbitrarily large k ; our construction is motivated by the examples described in [11]. We shall be defining several tensors. To simplify the discussion, we only give the non-zero entries in these tensors up to the usual symmetries.

1.8. The pseudo-Riemannian manifolds $\mathcal{M}_{6+4p,f}$. For $p \geq 1$, let

$$(x, z_0, \dots, z_p, \tilde{z}_0, \dots, \tilde{z}_p, x^*, z_0^*, \dots, z_p^*, \tilde{z}_0^*, \dots, \tilde{z}_p^*)$$

be coordinates on $\mathbb{R}^{6+4p}$. If f is a smooth function on $\mathbb{R}^{p+1}$, a *generalized plane wave* manifold $\mathcal{M}_{6+4p,f} := (\mathbb{R}^{6+4p}, g_{6+4p,f})$ of neutral signature $(3+2p, 3+2p)$ may

be defined by setting:

$$\begin{aligned} g_{6+4p,f}(\partial_x, \partial_x) &= -2\{f(z_0, \dots, z_p) + z_0\tilde{z}_0 + \dots + z_p\tilde{z}_p\}, \quad \text{and} \\ g_{6+4p,f}(\partial_x, \partial_{x^*}) &= g_{6+4p,f}(\partial_{z_i}, \partial_{z_i^*}) = g_{6+4p,f}(\partial_{\tilde{z}_i}, \partial_{\tilde{z}_i^*}) = 1. \end{aligned}$$

A word on notation. The *dual variables* $\{x^*, z_i^*, \tilde{z}_i^*\}$ enter only rather trivially; Theorem 1.6 below will imply that $\nabla^i R(\cdot)$ vanishes if any entry belongs to the span of $\{\partial_{x^*}, \partial_{z_i^*}, \partial_{\tilde{z}_i^*}\}$. Thus $\mathcal{M}_{6+4p,f}$ has a parallel totally isotropic distribution of maximal dimension. The dependence of the metric on the variables $\{\tilde{z}_0, \dots, \tilde{z}_p\}$ is fixed and ensures that the 0-model space is an indecomposable symmetric space. The crucial variables are $\{x, z_0, \dots, z_p\}$.

1.9. The geometry of the manifolds $\mathcal{M}_{6+4p,f}$.

Theorem 1.6.

- (1) *All geodesics in $\mathcal{M}_{6+4p,f}$ extend for infinite time.*
- (2) *$\exp_{P, \mathcal{M}_{6+4p,f}} : T_P \mathbb{R}^{6+4p} \rightarrow \mathbb{R}^{6+4p}$ is a diffeomorphism for all $P \in \mathbb{R}^{6+4p}$.*
- (3) *The non-zero components of $\nabla^k R$ are:*

$$\nabla^k R(\partial_x, \partial_{\xi_1}, \partial_{\xi_2}, \partial_x; \partial_{\xi_3}, \dots, \partial_{\xi_{k+2}}) = -\frac{1}{2}(\partial_{\xi_1} \cdots \partial_{\xi_{k+2}})g_{6+4p,f}(\partial_x, \partial_x)$$

for $\xi_i \in \{z_0, \dots, z_p, \tilde{z}_0, \dots, \tilde{z}_p\}$.

- (4) *All scalar Weyl invariants of $\mathcal{M}_{6+4p,f}$ vanish.*
- (5) *$\mathcal{M}_{6+4p,f}$ is a symmetric space if and only if f is at most quadratic.*

1.10. The symmetric space $\mathcal{S}_{6+4p}$.

Theorem 1.7. *Let $\mathcal{S}_{6+4p} := \mathcal{M}_{6+4p,0}$ be defined by $f = 0$. Then:*

- (1) *$\mathcal{S}_{6+4p}$ is an indecomposable symmetric space.*
- (2) *$\mathcal{M}_{6+4p,f}$ is 0-modeled on $\mathcal{S}_{6+4p}$ for any $f = f(z_0, \dots, z_p)$.*

1.11. The homogeneous spaces $\mathcal{H}_{6+4p,k}$. Theorems 1.6 and 1.7 show that Theorems 1.4 and 1 fail in the higher signature context. There are other interesting properties that this family of manifolds has. Construct a sequence of pseudo-Riemannian manifolds $\mathcal{H}_{6+4p,k} := \mathcal{M}_{6+4p,f_k}$ by defining:

$$f_k(z_0, \dots, z_p) := z_1 z_0^2 + \dots + z_k z_0^{k+1} \quad \text{if } 1 \leq k \leq p,$$

and as exceptional cases

$$\begin{aligned} f_{p+1}(z_0, \dots, z_p) &:= z_1 z_0^2 + \dots + z_p z_0^{p+1} + z_0^{p+3}, \quad \text{and} \\ f_{p+2}(z_0, \dots, z_p) &:= z_1 z_0^2 + \dots + z_p z_0^{p+1} + e^{z_0}. \end{aligned}$$

The following result shows that the local isometry type of a homogeneous space need not be determined by the first few covariant derivatives of the curvature tensor:

Theorem 1.8. *Let $1 \leq k \leq p+2$. Then:*

- (1) *$\mathcal{H}_{6+4p,k}$ is 0-modeled on the indecomposable symmetric space $\mathcal{S}_{6+4p}$.*
- (2) *If $j < k$, then*
 - (a) *$\mathcal{H}_{6+4p,k}$ is j -modeled on $\mathcal{H}_{6+4p,j}$.*
 - (b) *$\mathcal{H}_{6+4p,j}$ is not k -modeled on $\mathcal{H}_{6+4p,k}$.*
- (3) *$\mathcal{H}_{6+4p,k}$ is a homogeneous space which is not symmetric.*

1.12. **The manifolds $\mathcal{N}_{6+4p,\psi}$.** Let $\psi \in C^\infty(\mathbb{R})$ satisfy

$$\psi^{(p+3)}(z_0) > 0 \quad \text{and} \quad \psi^{(p+4)}(z_0) > 0 \quad \text{for all} \quad z_0 \in \mathbb{R}.$$

Let $\mathcal{N}_{6+4p,\psi} := \mathcal{M}_{6+4p,f_\psi}$ where

$$f_\psi := z_1 z_0^2 + \dots + z_p z_0^{p+1} + \psi(z_0).$$

The following Theorem shows that

$$\alpha_{6+4p,\psi}^k(P) := \psi^{(k+p+3)} \{ \psi^{(p+3)} \}^{k-1} \{ \psi^{(p+4)} \}^{-k}(P) \quad \text{for} \quad k \geq 2$$

forms a collection of affine invariants which determines the isometry types of these manifolds; these invariants are not of Weyl type. Again, this does not happen in the Riemannian setting.

Theorem 1.9. *Suppose that ψ_i are real analytic for $i = 1, 2$ and that $\psi_i^{(p+3)}$ and $\psi_i^{(p+4)}$ are positive. The following assertions are equivalent:*

- (1) *There exists a local diffeomorphism ϕ from $\mathcal{N}_{6+4p,\psi_1}$ to $\mathcal{N}_{6+4p,\psi_2}$ with $\phi(P_1) = P_2$ and $\phi^* \nabla_{\mathcal{N}_{6+4p,\psi_2}} = \nabla_{\mathcal{N}_{6+4p,\psi_1}}$.*
- (2) *We have $\alpha_{6+4p,\psi_1}^k(P_1) = \alpha_{6+4p,\psi_2}^k(P_2)$ for $k \geq 2$.*
- (3) *There exists an isometry $\phi : \mathcal{N}_{6+4p,\psi_1} \rightarrow \mathcal{N}_{6+4p,\psi_2}$ with $\phi(P_1) = P_2$.*

1.13. **Curvature and affine homogeneity.** One has the following Theorem:

Theorem 1.10. *Assume that $\psi^{(p+3)}$ and $\psi^{(p+4)}$ are positive. Then:*

- (1) *$\mathcal{N}_{6+4p,\psi}$ is 0-modeled on the indecomposable symmetric space $\mathcal{S}_{6+4p}$.*
- (2) *$\mathcal{N}_{6+4p,\psi}$ is j -modeled on the homogeneous space $\mathcal{H}_{6+4p,j}$ for $1 \leq j \leq p+2$.*
- (3) *$\mathcal{N}_{6+4p,\psi}$ is $(p+2)$ -curvature homogeneous.*
- (4) *The following conditions are equivalent:*
 - (a) *$\mathcal{N}_{6+4p,\psi}$ is homogeneous.*
 - (b) *$\mathcal{N}_{6+4p,\psi}$ is affine $(p+3)$ -curvature homogeneous.*
 - (c) *$\alpha_{6+4p,\psi}^2$ is constant.*
 - (d) *$\psi^{(p+3)} = ae^{bz_0}$ for some $a, b \neq 0$.*

Taking $\psi = e^{z_0} + e^{2z_0}$ constructs a manifold which is $(p+2)$ -modeled on the homogeneous space $\mathcal{N}_{6+4p,e^{z_0}}$, which is curvature 0-modeled on the indecomposable symmetric space $\mathcal{S}_{6+4p}$, and which is not affine $(p+3)$ -curvature homogeneous and hence not affine homogeneous.

2. COMPLETENESS

Proof of Theorem 1.6. To simplify the notation a bit, we introduce the variables

$$s = (s_1, \dots, s_{2+2p}) := (z_0, \dots, z_p, \tilde{z}_0, \dots, \tilde{z}_p), \quad \text{and} \\ s^* = (s_1^*, \dots, s_{2+2p}^*) := (z_0^*, \dots, z_p^*, \tilde{z}_0^*, \dots, \tilde{z}_p^*).$$

Let $1 \leq i \leq 2+2p$. The metric then takes the form

$$g_{6+4p,f}(\partial_x, \partial_x) = -2F(s) \quad \text{and} \quad g_{6+4p,f}(\partial_x, \partial_{x^*}) = g_{6+4p,f}(\partial_{s_i}, \partial_{s_i^*}) = 1.$$

for $F := f(z_0, \dots, z_p) + z_0 \tilde{z}_0 + z_1 \tilde{z}_1 + \dots + z_p \tilde{z}_p$. We compute the non-zero Christoffel symbols of the first and second kinds:

$$\begin{aligned} g_{6+4p,f}(\nabla_{\partial_x} \partial_x, \partial_{s_i}) &= \partial_{s_i} F, \\ g_{6+4p,f}(\nabla_{\partial_x} \partial_{s_i}, \partial_x) &= g_{6+4p,f}(\nabla_{\partial_{s_i}} \partial_x, \partial_x) = -\partial_{s_i} F, \\ \nabla_{\partial_x} \partial_x &= \sum_i \partial_{s_i} F \cdot \partial_{s_i^*}, \quad \text{and} \\ \nabla_{\partial_x} \partial_{s_i} &= \nabla_{\partial_{s_i}} \partial_x = -\partial_{s_i} F \cdot \partial_{x^*}. \end{aligned}$$

The curve $\gamma(t) = (x(t), s(t), x^*(t), s^*(t))$ is a geodesic if and only if

$$0 = \ddot{x}, \quad 0 = \ddot{s}_i, \quad 0 = \ddot{x}^* - 2\dot{x} \sum_i \dot{s}_i \partial_{s_i} F, \quad \text{and} \quad 0 = \ddot{s}_i^* + \dot{x} \dot{x} \partial_{s_i} F.$$

We solve the geodesic equation with initial conditions $\gamma(0) = (\alpha, \xi, \alpha^*, \xi^*)$ and $\dot{\gamma}(0) = (\beta, \eta, \beta^*, \eta^*)$ by setting:

$$\begin{aligned} x(t) &= \alpha + \beta t, & s_i(t) &= \xi_i + t\eta_i, \\ x^*(t) &= \alpha^* + \beta^* t + 2\beta \int_0^t \int_0^\tau \{\sum_i \eta_i \partial_{s_i} F(\xi + t\eta)\} d\sigma d\tau, \\ s_i^*(t) &= \xi_i^* + t\eta_i^* - \beta^2 \int_0^t \int_0^\tau \partial_{s_i} F(\xi + t\eta) d\sigma d\tau. \end{aligned}$$

The solution exists for all time. Furthermore, there exists a unique geodesic with $\gamma(0) = P$ and $\gamma(1) = Q$; this establishes Assertions (1) and (2).

Since $\nabla \partial_{x^*} = \nabla \partial_{s_i^*} = 0$, Assertion (3) follows as the quadratic terms in the Christoffel symbols play no role in the covariant derivatives. Let

$$\begin{aligned} \mathcal{V}_1 &:= \text{Span}\{\partial_x - \frac{1}{2}g_{6+4p,f}(\partial_x, \partial_x)\partial_{x^*}, \partial_{s_1}, \dots, \partial_{s_p}\}, \\ \mathcal{V}_2 &:= \text{Span}\{\partial_{x^*}, \partial_{s_1^*}, \dots, \partial_{s_p^*}\}. \end{aligned}$$

This decomposes $\mathbb{R}^{6+4p} = \mathcal{V}_1 \oplus \mathcal{V}_2$ as the direct sum of two totally isotropic subspaces. Since $\nabla^i R$ vanishes if any entry belongs to $\mathcal{V}_2$, $\nabla^i R$ is supported on $\mathcal{V}_1$. As $\mathcal{V}_1$ is totally isotropic, Assertion (4) follows. Assertion (5) is immediate from Assertion (3). $\square$

3. A 0-MODEL FOR $\mathcal{M}_{6+4p,f}$

It is convenient to work in the purely algebraic setting. Let V be an m dimensional vector space. Let

$$\mathfrak{M}^k := (V, \langle \cdot, \cdot \rangle, A^0, \dots, A^k)$$

where $\langle \cdot, \cdot \rangle$ is a non-degenerate inner product on V and where $A^i \in \otimes^{4+i} V^*$ satisfies the appropriate symmetries of the covariant derivatives of the curvature tensor; if $k = \infty$, then the sequence is infinite. We say that $\mathfrak{M}$ is a k -model for $\mathcal{M} = (M, g)$ if for each point $P \in M$, there is an isomorphism $\phi : T_P M \rightarrow V$ so that

$$\phi^* \langle \cdot, \cdot \rangle = g_P \quad \text{and} \quad \phi^* A^i = \nabla^i R_P \quad \text{for } 0 \leq i \leq k.$$

Clearly $\mathcal{M}$ is k -curvature homogeneous if and only if it admits a k -model as one could take $\mathfrak{M}^k := \mathfrak{M}^k(\mathcal{M}, P)$ for any $P \in M$.

3.1. Models for the manifolds $\mathcal{M}_{6+4p,f}$. Let

$$\{X, Z_0, \dots, Z_p, \tilde{Z}_0, \dots, \tilde{Z}_p, X^*, Z_0^*, \dots, Z_p^*, \tilde{Z}_0^*, \dots, \tilde{Z}_p^*\}$$

be a basis for $\mathbb{R}^{6+4p}$. Define a hyperbolic inner product on $\mathbb{R}^{6+4p}$ by pairing ordinary variables with the corresponding dual variables:

$$\langle X, X^* \rangle = \langle Z_i, Z_i^* \rangle = \langle \tilde{Z}_i, \tilde{Z}_i^* \rangle = 1 \quad \text{for } 0 \leq i \leq p.$$

Define an algebraic curvature tensor A^0 supported on $\text{Span}\{X, Z_i, \tilde{Z}_i\}$ by:

$$A^0(X, Z_i, \tilde{Z}_i, X) = 1 \quad \text{for } 0 \leq i \leq p.$$

Define higher order covariant derivative curvature tensors A^i for $1 \leq i \leq p$ by:

$$\begin{aligned} A^i(X, Z_0, Z_i, X; Z_0, \dots, Z_0) &= 1, \\ A^i(X, Z_0, Z_0, X; Z_i, Z_0, \dots, Z_0) &= 1, \dots, \\ A^i(X, Z_0, Z_0, X; Z_0, \dots, Z_0, Z_i) &= 1. \end{aligned}$$

The vectors $\{Z_i, \tilde{Z}_i\}$ for $0 \leq i \leq p$ are linked by A^0 ; the vectors Z_0 and Z_i are linked by A^i for $1 \leq i \leq p$. Set

$$\begin{aligned} A^{p+1}(X, Z_0, Z_0, X; Z_0, \dots, Z_0) &= 1, \quad \text{and} \\ A^{p+2}(X, Z_0, Z_0, X; Z_0, \dots, Z_0) &= 1. \end{aligned}$$

For $0 \leq k \leq p+2$, we define models:

$$\mathfrak{M}_{6+4p}^k := (\mathbb{R}^{6+4p}, \langle \cdot, \cdot \rangle, A^0, \dots, A^k).$$

Proof of Theorem 1.7. Let $0 \leq i, j \leq p$. By Theorem 1.6,

$$R(\partial_x, \partial_{z_i}, \partial_{\tilde{z}_i}, \partial_x) = 1 \quad \text{and} \quad R(\partial_x, \partial_{z_i}, \partial_{z_j}, \partial_x) = \partial_{z_i} \partial_{z_j} F$$

where $F = f(z_0, \dots, z_p) + z_0 \tilde{z}_0 + \dots + z_p \tilde{z}_p$. We set

$$(3.a) \quad \begin{aligned} X &:= \partial_x + F \partial_{x^*}, & X^* &:= \partial_{x^*}, \\ Z_i &:= \partial_{z_i} - \frac{1}{2} \sum_j \partial_{z_i} \partial_{z_j} f \cdot \partial_{\tilde{z}_j}, & Z_i^* &:= \partial_{z_i^*}, \\ \tilde{Z}_i &:= \partial_{\tilde{z}_i}, & \tilde{Z}_i^* &:= \partial_{\tilde{z}_i^*} + \frac{1}{2} \sum_j \partial_{z_i} \partial_{z_j} f \cdot \partial_{z_j^*}. \end{aligned}$$

We show that $\mathfrak{M}_{6+4p}^0$ is a 0-model for $\mathcal{M}_{6+4p,f}$ by noting that the non-zero components of $g_{6+4p,f}$ and R are then given by

$$(3.b) \quad \begin{aligned} g_{6+4p,f}(X, X^*) &= g_{6+4p,f}(Z_i, Z_i^*) = g_{6+4p,f}(\tilde{Z}_i, \tilde{Z}_i^*) = 1, \quad \text{and} \\ R(X, Z_i, \tilde{Z}_i, X) &= 1 \quad \text{for } 0 \leq i \leq p. \end{aligned}$$

By Theorem 1.6, $\mathcal{S}_{6+4p}$ is a symmetric space. As $\mathfrak{M}_{6+4p}^0$ is a 0-model for $\mathcal{S}_{6+4p}$ and $\mathfrak{M}_{6+4p}^0$ is a 0-model for $\mathcal{M}_{6+4p,f}$, $\mathcal{S}_{6+4p}$ is a 0-model for $\mathcal{M}_{6+4p,f}$. To show complete the proof, we must only show $\mathfrak{M}_{6+4p}^0$ is indecomposable.

Suppose we have a non-trivial decomposition $\mathbb{R}^{6+4p} = V_1 \oplus V_2$ such that

$$A^0 = A_1^0 \oplus A_2^0 \quad \text{and} \quad \langle \cdot, \cdot \rangle = \langle \cdot, \cdot \rangle_1 \oplus \langle \cdot, \cdot \rangle_2.$$

We argue for a contradiction. Denote the natural projections induced by this decomposition by $\pi_i : \mathbb{R}^{6+4p} \rightarrow V_i$. Since

$$1 = \langle X, X^* \rangle = \langle \pi_1 X, X^* \rangle + \langle \pi_2 X, X^* \rangle$$

we may assume without loss of generality $\langle \pi_1 X, X^* \rangle \neq 0$. Set $\alpha := \pi_1(X)$. Let $\beta \in (X^*)^\perp \cap V_2$. Then $A^0(\alpha, \cdot, \beta, \alpha) = 0$ as $\alpha \in V_1$ and $\beta \in V_2$. Since β doesn't involve X ,

$$\begin{aligned} 0 &= A^0(\alpha, Z_i, \beta, \alpha) = \langle \alpha, X^* \rangle^2 \langle \beta, \tilde{Z}_i^* \rangle, \quad \text{and} \\ 0 &= A^0(\alpha, \tilde{Z}_i, \beta, \alpha) = \langle \alpha, X^* \rangle^2 \langle \beta, Z_i^* \rangle. \end{aligned}$$

Consequently $\langle \beta, X^* \rangle = 0$, $\langle \beta, Z_i^* \rangle = 0$, and $\langle \beta, \tilde{Z}_i^* \rangle = 0$. Thus

$$\beta \in \text{Span}\{X^*, Z_0^*, \dots, Z_p^*, \tilde{Z}_0^*, \dots, \tilde{Z}_p^*\}$$

so $(X^*)^\perp \cap V_2$ is totally isotropic. Since the restriction of $\langle \cdot, \cdot \rangle$ to V_2 is non-degenerate and since

$$\dim\{(X^*)^\perp \cap V_2\} \geq \dim\{V_2\} - 1,$$

we conclude that $\dim\{V_2\} = 2$. Furthermore there must exist an element of V_2 not in $(X^*)^\perp$. We can therefore interchange the roles of V_1 and V_2 to see that $\dim\{V_1\} = 2$. Consequently $6 + 4p = \dim\{V_1\} + \dim\{V_2\} = 4$ which provides the desired contradiction. $\square$

Theorem 1.8 (1) and Theorem 1.10 (1) are special cases of Theorem 1.7 (2). Theorem 1.8 (2b) follows since $\nabla^j R_{\mathcal{H}_{6+4p,k}} = 0$ if $j > k$ whereas $\nabla^j R_{\mathcal{H}_{6+4p,j}} \neq 0$. Theorem 1.8 (2a) and Theorem 1.10 (2, 3) will follow from the following result.

Lemma 3.1.

- (1) If $f = \psi(z_0) + z_1 z_0^2 + \dots + z_k z_0^{k+1}$ for $1 \leq k \leq p$, then $\mathfrak{M}_{6+4p}^k$ is a k -model for $\mathcal{M}_{6+4p,f}$.
- (2) If $f = \psi(z_0) + z_1 z_0^2 + \dots + z_p z_0^{p+1}$ and if $\psi^{(p+3)}$ is positive on $\mathbb{R}$, then $\mathfrak{M}_{6+4p}^{p+1}$ is a $(p+1)$ -model for $\mathcal{M}_{6+4p,f}$.
- (3) If $f = \psi(z_0) + z_1 z_0^2 + \dots + z_p z_0^{p+1}$ and if $\psi^{(p+3)}$ and $\psi^{(p+4)}$ are positive on $\mathbb{R}$, then $\mathfrak{M}_{6+4p}^{p+2}$ is a $(p+2)$ -model for $\mathcal{M}_{6+4p,f}$.

Proof. We adopt the notation of Equation (3.a). The normalizations of Equation (3.b) are then satisfied. Suppose $f = \psi(z_0) + z_1 z_0^2 + \dots + z_k z_0^{k+1}$. If $1 \leq i \leq k$ and $1 \leq j \leq p$,

$$\begin{aligned}\nabla^i R(X, Z_0, Z_0, X; Z_0, \dots, Z_0) &= \varepsilon_i, \\ \nabla^i R(X, Z_0, Z_j, X; Z_0, \dots, Z_0) &= \varepsilon_{j,i}, \\ \nabla^i R(X, Z_0, Z_0, X; Z_0, \dots, Z_j, \dots, Z_0) &= \varepsilon_{j,i}\end{aligned}$$

where $\varepsilon_i = (\partial_{z_0})^{i+2} f$ and $\varepsilon_{j,i} = (\partial_{z_0})^{i+1} \partial_{z_j} f$. Note that

$$\varepsilon_{i,i} \neq 0 \quad \text{for } 1 \leq i \leq k \quad \text{and} \quad \varepsilon_{j,i} = 0 \quad \text{for } 1 \leq j < i \leq k.$$

To prove Assertion (1), we must define a new frame $\{{}^1X, {}^1X^*, {}^1Z_i, {}^1\tilde{Z}_i, {}^1Z_i^*, {}^1\tilde{Z}_i^*\}$ so that in addition to the relations of Equation (3.b), the only non-zero components of $\nabla^i R$ are given by

$$\begin{aligned}(3.c) \quad \nabla^i R({}^1X, {}^1Z_0, {}^1Z_i, {}^1X; {}^1Z_0, \dots, {}^1Z_0) &= \dots \\ &= \nabla^i R({}^1X, {}^1Z_0, {}^1Z_0, {}^1X; {}^1Z_0, \dots, {}^1Z_0, {}^1Z_i) = 1.\end{aligned}$$

Set

$${}^1X := X \quad \text{and} \quad {}^1Z_0 := Z_0 + a_1 Z_1 + \dots + a_k Z_k.$$

To ensure $\nabla^\ell R({}^1X, {}^1Z_0, {}^1Z_0, {}^1X; {}^1Z_0, \dots, {}^1Z_0) = 0$ for $1 \leq \ell \leq k$, we must have:

$$\begin{aligned}0 &= \varepsilon_k + (k+2)\varepsilon_{k,k}a_k, \\ 0 &= \varepsilon_{k-1} + (k+1)\{\varepsilon_{k,k-1}a_k + \varepsilon_{k-1,k-1}a_{k-1}\}, \dots \\ 0 &= \varepsilon_1 + 3\{\varepsilon_{k,1}a_k + \dots + \varepsilon_{1,1}a_1\}.\end{aligned}$$

Because $\varepsilon_{i,i} \neq 0$ for $1 \leq i \leq k$, this upper triangular system of equations is recursively solvable for $a_k, \dots, a_1$.

To ensure that

$$\begin{aligned}\nabla^i R({}^1X, {}^1Z_0, {}^1Z_i, {}^1X; {}^1Z_0, \dots, {}^1Z_0) &= \dots = 1, \quad \text{and} \\ \nabla^i R({}^1X, {}^1Z_0, {}^1Z_j, {}^1X; {}^1Z_0, \dots, {}^1Z_0) &= \dots = 0 \quad \text{for } i \neq j,\end{aligned}$$

we set ${}^1Z_i = Z_i$ for $k < i \leq p$, while for $1 \leq i \leq k$, we set

$${}^1Z_1 = a_{1,1}Z_1, \quad {}^1Z_2 = a_{2,1}Z_1 + a_{2,2}Z_2, \quad \dots \quad {}^1Z_k = a_{k,1}Z_1 + \dots + a_{k,k}Z_k.$$

To ensure that 1Z_k is properly normalized, the following relations must hold:

$$\begin{aligned}1 &= a_{k,k}\varepsilon_{k,k}, \\ 0 &= a_{k,k-1}\varepsilon_{k-1,k-1} + a_{k,k}\varepsilon_{k,k-1}, \dots \\ 0 &= a_{k,1}\varepsilon_{1,1} + \dots + a_{k,k}\varepsilon_{k,1}.\end{aligned}$$

This determines 1Z_k . We continue in this fashion to determine the remaining coefficients. This ensures the proper normalizations for $\nabla^i R$ for $1 \leq i \leq k$.

We now return to the relations of Equation (3.b) for g and R . We regard $R(X, \cdot, \cdot, X)$ as defining a neutral signature inner product on

$$\text{Span}\{\partial_{z_0}, \dots, \partial_{z_p}, \partial_{\bar{z}_0}, \dots, \partial_{\bar{z}_p}\}.$$

Since ${}^1X = \partial_x + F\partial_{x^*}$ and since $\{{}^1Z_0, \dots, {}^1Z_p\} \subset \text{Span}\{Z_0, \dots, Z_p\}$ we may choose

$$\{{}^1\tilde{Z}_0, \dots, {}^1\tilde{Z}_p\} \subset \text{Span}\{\tilde{Z}_0, \dots, \tilde{Z}_p\}$$

so the only non-zero components of R are $R({}^1X, {}^1Z_i, {}^1\tilde{Z}_i, X) = 1$. Finally, we choose a dual basis

$$\{{}^1X^*, {}^1Z_0^*, \dots, {}^1Z_p^*, {}^1\tilde{Z}_0^*, \dots, {}^1\tilde{Z}_p^*\} \subset \text{Span}\{X^*, Z_0^*, \dots, Z_p^*, \tilde{Z}_0^*, \dots, \tilde{Z}_p^*\}$$

so the non-zero components of the metric g are

$$g({}^1X, {}^1X^*) = g({}^1Z_i, {}^1Z_i^*) = g({}^1\tilde{Z}_i, {}^1\tilde{Z}_i^*) = 1.$$

Assertion (1) of the Lemma now follows.

There is a final bit of flexibility that we use in proving Assertions (2) and (3) of the Lemma. The relations of Equation (3.b) continue to hold. We rescale the basis we have constructed by setting:

$$\begin{aligned} {}^2X &= \varepsilon \cdot {}^1X, & {}^2X^* &= \varepsilon^{-1} \cdot {}^1X^*, & {}^2Z_i &= \varepsilon_i \cdot {}^1Z_i, \\ {}^2Z_i^* &= \varepsilon_i^{-1} \cdot {}^1Z_i^*, & {}^2\tilde{Z}_i &= \varepsilon^{-2} \varepsilon_i^{-1} \cdot {}^1\tilde{Z}_i, & {}^2\tilde{Z}_i^* &= \varepsilon^2 \varepsilon_i \cdot {}^1\tilde{Z}_i^*. \end{aligned}$$

The non-zero components of g and of R are

$$\begin{aligned} g({}^2X, {}^2X^*) &= g({}^2Z_i, {}^2Z_i^*) = g({}^2\tilde{Z}_i, {}^2\tilde{Z}_i^*) = 1, \\ R({}^2X, {}^2Z_i, {}^2\tilde{Z}_i, {}^2X) &= 1. \end{aligned}$$

for $0 \leq i \leq p$. The non-zero components of $\nabla^i R$ for $1 \leq i \leq p$ are

$$\begin{aligned} \nabla^i R({}^2X, {}^2Z_0, {}^2Z_i, {}^2X; {}^2Z_0, \dots, {}^2Z_0) &= \dots \\ &= \nabla^i R({}^2X, {}^2Z_0, {}^2Z_0, {}^2X; {}^2Z_0, \dots, {}^2Z_i) = \varepsilon^2 \varepsilon_i \varepsilon_0^{i+1}. \end{aligned}$$

The non-zero components of $\nabla^{p+1} R$ and $\nabla^{p+2} R$ are:

$$\begin{aligned} \nabla^{p+1} R({}^2X, {}^2Z_0, {}^2Z_0, {}^2X; {}^2Z_0, \dots, {}^2Z_0) &= \varepsilon^2 \varepsilon_0^{p+3} \psi^{(p+3)}, \\ \nabla^{p+2} R({}^2X, {}^2Z_0, {}^2Z_0, {}^2X; {}^2Z_0, \dots, {}^2Z_0) &= \varepsilon^2 \varepsilon_0^{p+4} \psi^{(p+4)}. \end{aligned}$$

We set $\varepsilon_i := \varepsilon^{-2} \varepsilon_0^{-i-1}$ for $1 \leq i \leq p$ to ensure $\nabla^i R$ has the proper normalization for $1 \leq i \leq p$. Suppose that $\psi^{(p+3)}$ is positive on $\mathbb{R}$. We normalize $\nabla^{p+1} R$ and prove Assertion (2) of the Lemma by setting:

$$\varepsilon_0 = 1 \quad \text{and} \quad \varepsilon = \{\psi^{(p+3)}\}^{-1/2}.$$

If additionally $\psi^{(p+4)}$ is positive on $\mathbb{R}$, we may set

$$\varepsilon_0 := \psi^{(p+3)} \{\psi^{(p+4)}\}^{-1} \quad \text{and} \quad \varepsilon = \{\varepsilon_0^{p+3} \psi^{(p+3)}\}^{-1/2}$$

to ensure that both ∇^{p+1} and ∇^{p+2} are normalized appropriately. This establishes Assertion (3) of the Lemma. $\square$

4. ISOMETRIES

Let $\mathfrak{M}^\infty(\mathcal{M}, P) = (T_P M, g_{\mathcal{M}}, R_{\mathcal{M}, P}, \dots, \nabla^i R_{\mathcal{M}, P}, \dots)$ be the full model at a point P of a pseudo-Riemannian manifold $\mathcal{M}$. This encodes complete information about the isometry type of the manifold under certain circumstances:

Lemma 4.1. *Let $\mathcal{M}_i := (M_i, g_i)$ be real analytic pseudo-Riemannian manifolds for $i = 1, 2$. Assume there exist points $P_i \in M_i$ so $\exp_{P_i, \mathcal{M}_i} : T_{P_i} M_i \rightarrow M_i$ is a diffeomorphism and so there exists an isomorphism Φ between $\mathfrak{M}^\infty(\mathcal{M}_1, P_1)$ and $\mathfrak{M}^\infty(\mathcal{M}_2, P_2)$. Then $\phi := \exp_{P_2, \mathcal{M}_2} \circ \Phi \circ \exp_{P_1, \mathcal{M}_1}^{-1}$ is an isometry from $\mathcal{M}_1$ to $\mathcal{M}_2$.*

Proof. Belger and Kowalski [1] note about analytic pseudo-Riemannian metrics that the “metric g is uniquely determined, up to local isometry, by the tensors $R, \nabla R, \dots, \nabla^k R, \dots$ at one point.”; see also Gray [12] for related work. The desired result now follows. $\square$

Proof of Theorem 1.9. Let $f = \psi(z_0) + z_1 z_0^2 + \dots + z_p z_0^{p+1}$. We assume $\psi^{(p+3)}$ and $\psi^{(p+4)}$ are positive. If $k \geq p+1$, then the non-zero components of the curvature operator $\nabla^k \mathcal{R}$ are given by

$$\begin{aligned} (\nabla_{\partial_{z_0}})^k \mathcal{R}(\partial_x, \partial_{z_0}) \partial_{z_0} &= -(\nabla_{\partial_{z_0}})^k \mathcal{R}(\partial_{z_0}, \partial_x) \partial_{z_0} = \psi^{(k+2)} \partial_{x^*}, \quad \text{and} \\ (\nabla_{\partial_{z_0}})^k \mathcal{R}(\partial_x, \partial_{z_0}) \partial_x &= -(\nabla_{\partial_{z_0}})^k \mathcal{R}(\partial_{z_0}, \partial_x) \partial_x = -\psi^{(k+2)} \partial_{z_0^*}. \end{aligned}$$

Choose $X, Z_0 \in T_P \mathbb{R}^{6+4p}$ and $\Theta \in T_P^*(\mathbb{R}^{6+4p})$ so:

$$(4.a) \quad \Theta\{(\nabla_{Z_0})^{p+1} \mathcal{R}(X, Z_0) X\} \neq 0.$$

For example one could take $\Theta = dz_0^*$, $X = \partial_x$ and $Z_0 = \partial_{z_0}$. Equation (4.a) is an invariant of the affine $p+1$ -model as it does not depend on the metric and is preserved by local affine isomorphisms. Expand

$$\begin{aligned} X &= a\partial_x + a^*\partial_{x^*} + \sum_i \{a_i\partial_{z_i} + \tilde{a}_i\partial_{\tilde{z}_i} + a_i^*\partial_{z_i^*} + \tilde{a}_i^*\partial_{\tilde{z}_i^*}\}, \\ Z_0 &= b\partial_x + b^*\partial_{x^*} + \sum_i \{b_i\partial_{z_i} + \tilde{b}_i\partial_{\tilde{z}_i} + b_i^*\partial_{z_i^*} + \tilde{b}_i^*\partial_{\tilde{z}_i^*}\}. \end{aligned}$$

If $k \geq p+1$,

$$\begin{aligned} \Theta\{(\nabla_{Z_0})^k \mathcal{R}(X, Z_0)X\} &= (ab_0 - ba_0)b_0^k \Theta\{(\nabla_{\partial_{z_0}})^k \mathcal{R}(\partial_x, \partial_{z_0})(a\partial_x + a_0\partial_{z_0})\} \\ &= (ba_0 - ab_0)b_0^k \psi^{(k+2)} \Theta(a\partial_{z_0^*} - a_0\partial_{x^*}). \end{aligned}$$

By hypothesis this is non-zero when $k = p+1$. Thus

$$a \neq 0, \quad b_0 \neq 0, \quad ba_0 - ab_0 \neq 0, \quad \text{and} \quad \Theta(a\partial_{z_0^*} - a_0\partial_{x^*}) \neq 0.$$

Set $\gamma := \Theta(a\partial_{z_0^*} - a_0\partial_{x^*})$. We may now compute:

$$\begin{aligned} &\frac{\Theta\{(\nabla_{Z_0})^{k+p+1} \mathcal{R}(X, Z_0)Z_0\} \{\Theta\{(\nabla_{Z_0})^{p+1} \mathcal{R}(X, Z_0)Z_0\}\}^{k-1}}{\{\Theta\{(\nabla_{Z_0})^{p+2} \mathcal{R}(X, Z_0)Z_0\}\}^k} \\ &= \frac{(ba_0 - ab_0)b_0^{k+p+1} \psi^{(k+p+3)} \gamma \cdot \{(ba_0 - ab_0)b_0^{p+1} \psi^{(p+3)} \gamma\}^{k-1}}{\{(ba_0 - ab_0)b_0^{p+2} \psi^{(p+4)} \gamma\}^k} \\ &= \psi^{(k+p+3)} \{\psi^{(p+3)}\}^{k-1} \{\psi^{(p+4)}\}^{-k} = \alpha_{6+4p, \psi}^k. \end{aligned}$$

This shows that $\alpha_{6+4p, \psi}^k$ is an affine invariant. Consequently Assertion (1) implies Assertion (2) in Theorem 1.9.

We now show Assertion (2) implies Assertion (3) in Theorem 1.9; this will complete the proof as it is immediate that Assertion (3) implies Assertion (1). By Lemma 3.1 (3), we can choose a basis $\{X, X^*, Z_i, \tilde{Z}_i, Z_i^*, \tilde{Z}_i^*\}$ which normalizes $g_{6+4p, f}$ and $\nabla^i R$ appropriately for $0 \leq i \leq p+2$. Since

$$\nabla^i R(X, Z_0, Z_0, X; Z_0, \dots, Z_0) = 1 \quad \text{for} \quad i = p+1, p+2,$$

we have

$$\nabla^{k+p+1} R(X, Z_0, Z_0, X; Z_0, \dots, Z_0) = \alpha_{6+4p, \psi}^k \quad \text{for} \quad k \geq 2.$$

This shows that the higher covariant derivatives are controlled by $\alpha_{6+4p, \psi}^k$. Consequently if $\alpha_{6+4p, \psi_1}^k(P_1) = \alpha_{6+4p, \psi_2}^k(P_2)$ for $k \geq 2$, there is an isomorphism between $\mathfrak{M}^\infty(\mathcal{N}_{6+4p, \psi_1}, P_1)$ and $\mathfrak{M}^\infty(\mathcal{N}_{6+4p, \psi_2}, P_2)$ and hence by Lemma 4.1 an isometry between $(\mathcal{N}_{6+4p, \psi_1}, P_1)$ and $(\mathcal{N}_{6+4p, \psi_2}, P_2)$ as desired. $\square$

Proof of Theorem 1.8 (4). Let $f_k := z_1 z_0^2 + \dots + z_k z_0^{k+1}$. Let $P_i \in \mathbb{R}^{6+4p}$. By Lemma 4.1,

$$(4.b) \quad \mathfrak{M}^i(\mathcal{M}_{6+4p, f_k}, P_1) \approx \mathfrak{M}^i(\mathcal{M}_{6+4p, f_k}, P_2)$$

for $i = k$. Since $\nabla^j R = 0$ for $j > k$, we may take $i = \infty$ in Equation (4.b). Thus by Lemma 4.1, there is an isometry of $\mathcal{M}_{6+4p, f_k}$ taking P_1 to P_2 . This shows $\mathcal{M}_{6+4p, f}$ is a homogeneous space. The argument is the same if $f = z_1 z_0^2 + \dots + z_p z_0^{p+1} + z_0^{p+3}$ where we start with $i = p+1$ in Equation (4.b).

If $f = z_1 z_0^2 + \dots + z_p z_0^{p+1} + a e^{bz_0}$, then

$$\alpha_{6+4p, \psi}^k = b^{k+p+3} b^{(p+3)(k-1)} b^{(p+4)(-k)}$$

is independent of the point in question. We use Theorem 1.9 (2) to see $\mathcal{M}_{6+4p, f}$ is a homogeneous space. $\square$

Proof of Theorem 1.10 (4). By Theorem 1.9, (4a) $\Rightarrow$ (4b) $\Rightarrow$ (4c). Set $h = \psi^{(p+3)}$. If (4c) holds, then

$$k = \alpha_{6+4p,\psi}^2 = h^{(2)} h \{h^{(1)}\}^{-2}.$$

We integrate the relation $h^{(2)} h = k h^{(1)} h^{(1)}$ to see there exist (a, b) so

$$h(z_0) = \begin{cases} ae^{bz_0} & \text{if } k = 1, \\ a(z_0 + b)^{1/(1-k)} & \text{if } k \neq 1. \end{cases}$$

Since $a(z_0 + b)^{1/(1-k)}$ vanishes when $z_0 = -b$, these solutions are ruled out by the assumption h is always positive and smooth. Consequently $h(z_0) = ae^{bz_0}$ and (4d) holds. By Theorem 1.9, (4d) $\Rightarrow$ (4a). $\square$
